

History of the Crested Ibis

-Past to Present-

Sado Ranger Office, Ministry of the Environment

Profile of the Crested Ibis

- Classification Pelecaniformes Threskiornithidae
- Scientific Name *Nipponia nippon*
- Size Total Length : About 75 cm
Wing Span : About 140 cm
Weight : About 1.8 kg
- Conservation Status Critically Endangered (Japan)
Endangered (IUCN Red List)
- Designations
Special Natural Monument (Law for the Protection of Cultural Properties)
Nationally Endangered Species of Wild Fauna and Flora (Species Conservation Act)
Internationally Protected Bird

Chronology of the Crested Ibis

■ Until the Edo Era

Distributed in a wide area of eastern Japan in the early Edo Era, but the ban on hunting by the Shogunate and the protection by daimyos increased the population of the bird, resulting in even wider distribution.

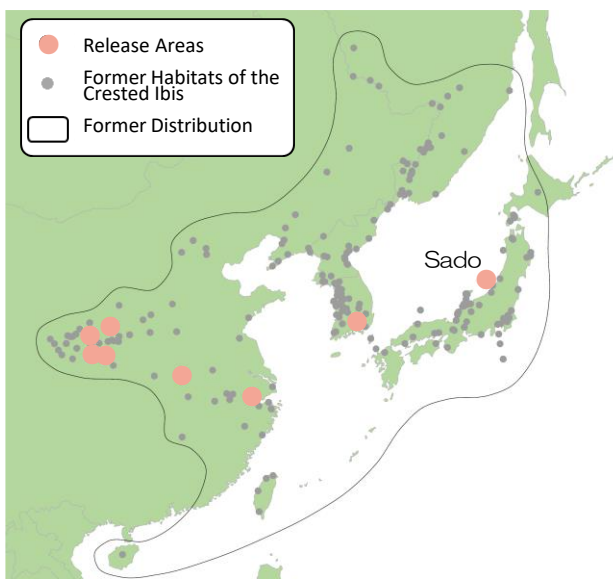

■ Meiji Era

Removal of the hunting ban resulted in a drastic decline in its population due to uncontrolled hunting.

Eliminated as vermin, sold as medicine, exported as a decorative item.

- 1908 Game Act Enforcement Regulations designated the bird as a protected bird
- 1926 Extinction registered due to uncontrolled hunting
- 1929 Crested ibis rediscovered on the Noto Peninsula
- 1931 Living crested ibis reported on Sado Island
A wildlife safety zone established on Mt. Bijo on the Noto Peninsula
- 1934 Designation as a natural monument (Act on Protection of Cultural Properties)
- 1946 An attempt to feed crested ibis started by residents of Sado
- 1952 Designation as a special natural monument
- 1953 Inauguration of the Sado Toki Welfare Association (reorganized as the Sado Toki Conservation Association in 1959)
- 1957 Inauguration of the Hakui Toki Conservation Association
- 1959 Inauguration of the Crested Ibis Conservation and Propagation Project (Agency for Cultural Affairs and Niigata Prefectural Board of Education)
Inauguration of the Niibo Toki Welfare Association
 - ▶ Surveillance campaign prohibited entry to breeding sites in the mountains
 - ▶ Feeding activities and establishment of pesticide-free feeding grounds
 - ▶ Movement for purchasing nationally-owned forest lands to secure crested ibis habitats
- 1962 Nesting habitat area nationalized
- 1967 Inauguration of the Sado Japanese Crested Ibis Conservation Center
- 1970 The last crested ibis living on the main island of Japan, named Nori, moved from Noto to Sado Island
- 1971 Inauguration of the Crested Ibis Protection Society of Ryotsu
- 1971 Inauguration of the Environmental Agency (spun off from the Agency for Cultural Affairs in 1975)
- 1981 All five wild crested ibises captured, thus extinct in the wild
- 1981 Rediscovery of wild crested ibises in China
- 1993 Categorized in the nationally endangered species of wild fauna and flora (Act on Conservation of Endangered Species)
- 1999 Two crested ibises sent by China as a gift (You-you and Yang-yang)
The first successful captive breeding case in Japan (birth of Yu-yu)
- 2003 The Environmental Restoration Vision created, a material plan for them returning to the wild
Kin, the last crested ibis born in Japan, died

Distribution of Crested Ibis

Created based on Yamashina and Nakanishi (1983), Birdlife International (2001), Ishikawa Prefectural Museum of History (2010), Park et al. (2010), and So and Kawai (2015).

2014	Reached the goal of "having 60 crested ibises settled within Sado Island"			
2016	<p>Development of the Roadmap for Crested Ibis to Return to the Wild 2020, with the goal of having 220 crested ibises settled</p>	Birth of purely wild crested ibis. Inauguration of the counting program of crested ibises leaving their nests		
2018	Reached the goal of "having 220 crested ibises settled within Sado Island"			
			The use of neonicotinoid pesticides completely terminated in wet-rice cultivation (JA Sado)	Inauguration of Toki Observation Post (Toki no Mikata Teiryujo)
2019	Redesignated from "Extinct in the Wild(EW)" to "Critically Endangered(CR)"			
2021	<p>Revised program of the Crested Ibis Protection and Reproduction Program</p> <p>Roadmap for Crested Ibis to Return to the Wild 2025 developed</p>	Released throughout Sado Island		Inauguration of "Toki no Terrace"

Captive Breeding

-Ex Situ Conservation-

Sado Ranger Office, Ministry of the Environment

Captive Breeding of Crested Ibis

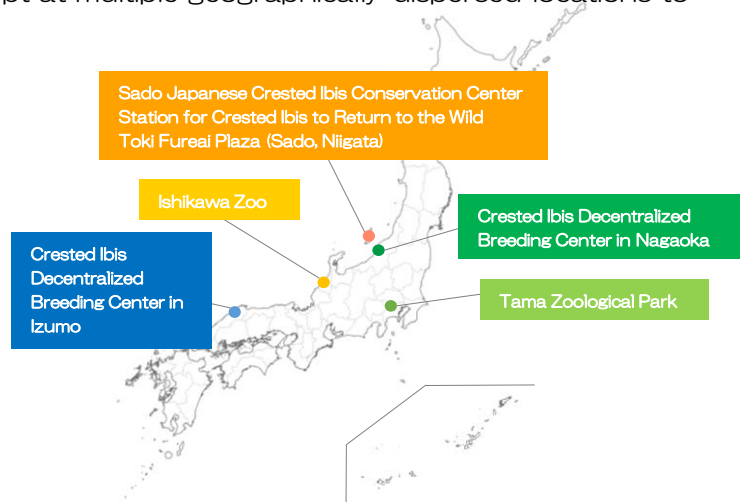

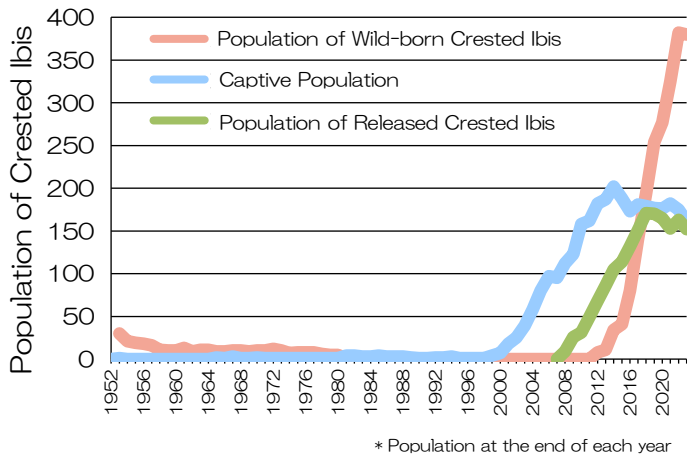

Domestically, efforts have been made to establish captive breeding methods for crested ibis mainly at Sado Japanese Crested Ibis Conservation Center in Niigata Prefecture.

A pair of crested ibises (You-you and Yang-yang) was brought to Japan from China in 1999. In the same year, Yu-yu was born, which marked the first successful case of a crested ibis' artificial hatching in Japan. Since then, captive breeding has been successful year after year and the population of crested ibis has increased gradually.

Population of Crested Ibis in Captivity and Decentralized Breeding Efforts

As a measure against risks posed by environmental changes and infectious diseases, including avian influenza, approximately 200 crested ibises are kept at multiple geographically-dispersed locations to secure a population to be released.

Restoring the Genetic Diversity of the Crested Ibis

Seven crested ibises were donated by China, becoming the first generation to reproduce later generations to secure the genetic diversity of the species.

Pre-release Training and Release -Into the Vast Sky Over Sado Island-

Sado Ranger Office, Ministry of the Environment

Station for Crested Ibis to Return to the Wild and Pre-release Training

In 2003, the “Environmental Restoration Vision” was established to set a practical goal for Crested Ibis reintroduction in the wild.

In 2007, the Station for Crested Ibis to Return to the Wild was founded as a training facility for crested ibises to acquire abilities necessary to survive in the wild.

In September 2008, the first group of crested ibises was released. So far, a total of 29 groups have been released, sending 490 crested ibises in to the wild.

◀ First Group of Crested Ibis Released in the Wild

▶ Pre-release Training Cages in an Environment Closed to Nature

Purposes of Pre-release Training

The training lasts about three months to let crested ibises acquire four key skills to survive in the wild after release.

① Foraging

The birds search for prey in muddy ponds similar to rice paddies by using the senses on the tip of their beak.

② Flying

Birds learn to fly inside a spacious cage, measuring 80 meters long by 50 meters wide by 15 meters high.

③ Flocking

Birds develop a habit of flocking by being trained to stay in a group of about twenty.

④ Acclimation to Human Activities

This gives the crested ibises opportunities to get used to human activities by showing them some farming activities, including mowing, and approaching vehicles, among others.

Outcomes of Releases through Today and Survival Rates of Released Crested Ibis

We currently use two ways to release birds in to the wild: One is called “hard release,” where crested ibises are transported to a release point and set free from boxes there; whereas the other one is called “soft release,” where the cage is opened to let the crested ibises to fly out of it freely at their own will.

Crested Ibis in the Wild

-Post-release Behavior of Crested Ibises-

Sado Ranger Office, Ministry of the Environment

Wild Crested Ibis Population and Its Evolution

The continued releases of crested ibises and successful breeding in the wild, the birds' population has increased to around 500.

Distribution of Crested Ibis

The plains of Sado Island are their main habitat.

Habitat of Crested Ibis

Both the shallow water areas for feeding and the forest areas for roosting and nesting are required for crested ibises to survive. In Sado, where the crested ibis is a symbol, environment-friendly agriculture, biotope development, natural regeneration of rivers and forests, forest management, and other activities are promoted to create a habitat for crested ibis.

Dispersal to the Mainland

There are 33 confirmed cases of crested ibises flying to the mainland so far. Some crested ibises have been confirmed about 300 km away from Sado.

Foraging Environment for Crested Ibis

Wild crested ibises prefer shallow water areas for foraging, but the frequency of their visits to rice paddies, biotopes, and ridges, etc., may vary depending on the season or the state of the rice paddies.

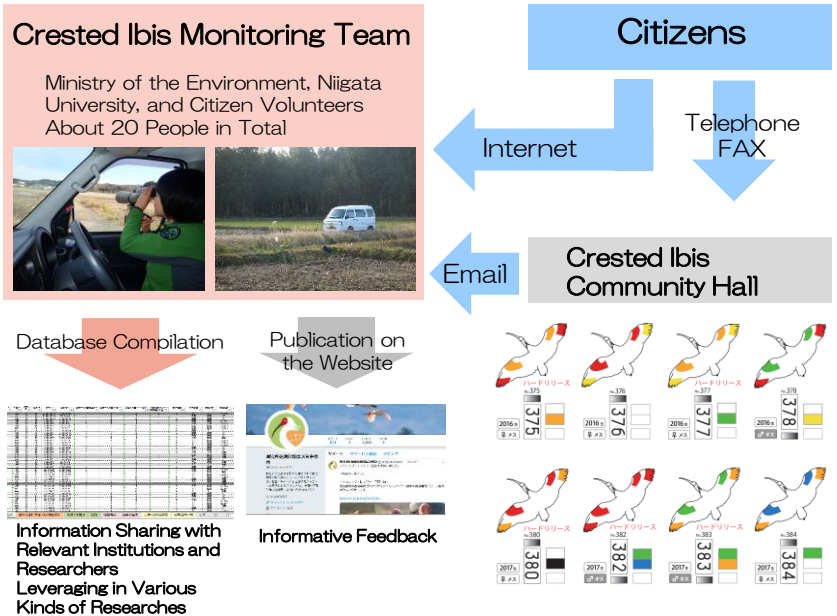

Monitoring the Crested Ibis

-Understanding the Progress of Reintroduction into the Wild-

Sado Ranger Office, Ministry of the Environment

What Do We Monitor about the Crested Ibises?

A research program monitors the population of crested ibis, their distribution, their survival rates, and their reproduction, among other metrics, to verify the progress of the crested ibises returning to the wild. The crested ibis monitoring team, made up of members from the Ministry of the Environment, Niigata University, and citizen volunteers, conducts the research on an almost daily basis. In addition, information reported by citizen eyewitnesses also plays an important role. The outcomes obtained from the monitoring are made use of in the captive breeding of crested ibis and the improvement of their habitat.

Monitoring Methods

① Verification of Their Survival

Each crested ibis is identified with a marker painted on their wing or with a band on their leg to monitor an individual's survival. Causes of death are also investigated.

② Reproductive Research

Hatching and fledging are recorded by observing the nests of the crested ibises. Unsuccessful breeding cases are subject to investigation of the causes.

③ Counting Program of Crested Ibises Leaving Their Roosts

To keep track of the population of crested ibises throughout Sado Island, the number of birds flying out of their roosts is counted in September and November.

Your reporting on any crested ibis witnessed is much appreciated.

The population of crested ibises is increasing and their habitat is also expanding.

Any information from you serves as an important clue to understanding the situations of wild crested ibises. During the breeding season from February through July, in particular, information on the forests visited by crested ibises, among other information, could lead to the discovery of nesting sites. In case you have noticed any unusual behaviors of the crested ibises, such as the forests being particularly noisy lately, or crested ibises witnessed carrying branches, or if you have witnessed any crested ibises in an area in which they are rarely seen, please let us know.

The Progress of Wild Crested Ibis Breeding

-Birth of New Life-

Sado Ranger Office, Ministry of the Environment

Color Evolutions in Crested Ibis Feathers

Sept. through Nov.

Basic Plumage

Coloration

Molting

Dec. through Aug.

Nuptial Plumage

Toki Color

The pale gentle pink feathers are one of the outstanding features of the crested ibis.

Makeup Colors

In around December, crested ibises rub the dark skin of their necks on their heads and down their backs as they bathe, resulting in the color of the feathers turning gray. No other bird in the world shows this change in feather colors. The change in the colors of the plumage signifies the start of their breeding season.

Crested Ibis Breeding Cycles

Around January, the crested ibises start to exhibit courtship displays and find their mates.

Around February, they build nests, and lay eggs around March. The male and the female take turns keeping their eggs warm, until they hatch in about 28 days. After hatching, both the male and the female bring food for their chicks until they leave the nest at about 40 days.

When the breeding season ends, they form a flock inclusive of the juveniles that have just left their nest in the same year.

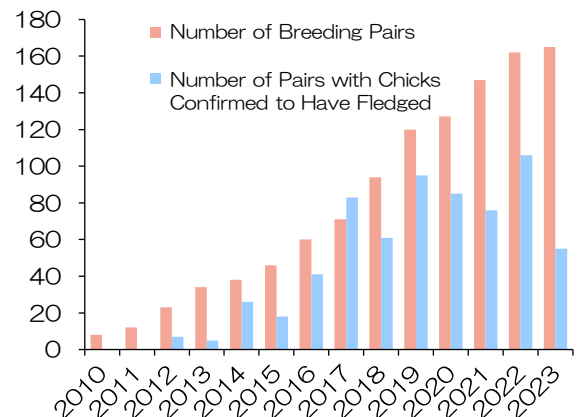

Results of Breeding to Date

In 2012, crested ibis chicks released from our facility fledged for the first time.

In 2016, chicks of the parents both born in the wild (purely wild crested ibises) fledged for the first time.

Results of Breeding to Date

Future of Crested Ibis Reintroduction

-For Coexistence of Humans and Crested Ibises-

Sado Ranger Office, Ministry of the Environment

How to Observe Crested Ibises -Support Them through Thoughtful Observation-

An increase in the population has provided more opportunities to observe wild crested ibises. The Ministry of the Environment has prepared “How to Observe Crested Ibises,” a leaflet that outlines appropriate ways of observing wild crested ibises, based on the “Guidelines for Coexistence with Crested Ibises”, as part of its enhanced awareness/education programs.

トキのみかた やさしい見方で あなたもトキの味方に

- ① Keep a distance from the crested ibises and observe them silently.
- ② Try not to disturb the community. Do not enter farmland without permission.
- ③ Stay inside your car when observing. (Do not block traffic.)
- ④ Avoid loud noises or lights.
- ⑤ Stay away from their nests during the breeding season (February through June).

Let's Meet Wild Crest Ibises!

Toki no Mikata Teiryujo (Toki Observation Post)

※ In front of the Observation Post

The post is located at the entrance to Crested Ibis Community Hall. The crested ibises can be observed flying across in front of the post or resting on the withered trees.

Crested Ibis Community Hall/Toki no Mikata Teiryujo

Address: 1101-1 Niibo Katagami, Sado
Phone: 0259-24-6040

Toki no Terrace

In the indoor observation room, there is an exhibition on wild crested ibis, and its rooftop provides a panoramic view of the nature-rich landscape of Sado, which wild crested ibises inhabit.

Toki no Terrace/Station for Crested Ibis to Return to the Wild

Address: 1277 Niibo Shomyoji, Sado
Phone: 0259-24-6151
